## KINBAXE

by Roberto Vitalini & Peggy Tan

---

Genetically-modified food, the much-touted solution to the hunger pangs of third-world nations, has been noted for a side effect that white-coated scientists were not expecting themselves to have to fend against. There is increasing data that suggest GM food is helping to yield crop of a different kind ... the modified human.

In the Kinbaxe ethnic group in Central Africa, newborns were observed over a period of 12 years. It is now a widely-known fact that Kinbaxe children have become physically and mentally superior in one generation. GM food has triggered a speedy evolution in this particular group of the human race. It is not far-fetched that as this phenomenon spreads throughout genetically-similar ethnic groups in Africa, that the continent becomes the new economic driving force of the world.

Previously 'civilized' societies go into chaos.
